"Contribution to the Determination of Aspartic Aminotransferase (GOT) (2.6.1.1.) and Alanine Transferase (GPT) (2.6.1.2.)."

Prague, Casopis Lekaru Ceskych, Vol 105, No 33, 19 Aug 66, pp 883 - 886

Abstract /Authors' English summary modified/: A modification of the method described by Reitman and Frankel is presented. The amount of serum used is decreased, and the incubation temperature reduced to 26°C. The enzyme reaction under these conditions has a linear course in normal and high values, and it is not necessary to repeat the analyses. Concentration of di-nitrophenylhydrazine is increased to correspond to the concentration of keto acids in the reaction mixture. 4 Figures, 2 Western, 3 Czech references. (Manuscript received Mar 66).

CA HORAK, M.

Condensation effect of stannic chloride. I. Preparation of diphenylacetic acid. M. Horák and J. Staněk (Charles Univ., Prague). *Czechoslovak Chem. Commun.*, 14, 651-4 (1949) (in English). $-Ph_2CHCO_2H$ (I) was prepd. by adding 15.2 g. $PhCH(OH)CO_2H$ (II) to 21 g. $SnCl_4$ and 15.6 g. C_6H_6 , refluxing the mixt. 1 hr. under a condenser fitted with a $CuCl_2$ tube, pouring it with stirring into 100 g. ice and 100 g. H_2O , extg. with three 100-ml. portions of Et_2O , washing the exts. with NaOH soln. until the washings gave no ppt. on acidification, boiling the alk. ext. to eliminate the Et_2O , nearly neutralizing with HCl, decolorizing with animal charcoal, then strongly acidifying with HCl; on cooling there septd. 13.0-10.2 g. (64-78%) crude I, m. 135-42%; one repptn. from an alk. soln. gives pure I, m. 146-7%. In good yield. The molar ratio $SnCl_4$:II must be 1:1 for best yields; if it is 1:2, no I is obtained; the use of more $SnCl_4$ did not improve the yield. If more than a 100% excess of C_6H_6 is used, the heating time must be longer; less leads to tar formation. E. U. Elam

SL-6

New application of the Perkin reaction. J. Stanek and M. Horak (Csl. Trav. chim. Technol., 1950, 15, 1037-1043). By use of Ac_2O and KOAc in presence of a small amount of I the condensation of PhCHO with active α -Me groups on a heterocyclic nucleus is effected. The yields are good and the process is more convenient than those described in the literature. In this way 2- and 4-styryl, 2, 6-distyryl, and 6-styryl-2-methyl-pyridine, 2-styrylquinoline, 3-benzylideneoxindole, and chalcone are prepared. PhCHO is not condensed with camphor, hydrocarbons (arenaphthalene, fluorene, $\text{C}_6\text{H}_5\text{Ph}$), and nitrotoluenes.

Heating a mixture of 2 : 6 dimethylpyridine (I) (0.2 mol.), PhCHO (0.42 mol.), and Ac_2O to boiling for 20 hr. gives 2 : 6-distyrylpyridine (II), m.p. 84 $^{\circ}$, in 21.5% yield which is raised to 25% by addition of anhyd. ZnCl_2 . A mixture of I (0.2 mol.), PhCHO (0.6 mol.), Ac_2O (0.8 mol.), KOAc (0.2 mol.) and a trace I heated to boiling for 40 hr. furnishes II (74%), $\text{C}_{17}\text{H}_{14}\text{N}$. Heating to boiling for 4 hr. a sparingly sol. (7.3%), and styryl 2-methylpyridine. II forms a sparingly sol. Ac_2O -M. CuH_2NCl , m.p. 211 $^{\circ}$, and is transformed by Br in Ac_2O into 2 : 6-di(1 : 2 dibromo-2'-methyl-4-phenylpyridine, m.p. 179 $^{\circ}$. Heating to boiling for 4 hr. a CuH_2NBr_2 (91%), m.p. 179 $^{\circ}$. Heating to boiling for 4 hr. a mixture of technical 2-picoline (\sim 0.5 mol.), PhCHO (0.7 mol.),

Ac_2O (0.5 mol.), and KOAc (50 g.) in presence of a trace of I furnishes 2-styrylpyridine (III) (80%), m.p. 88 $^{\circ}$. Comparison between the different samples of stilbene obtained from technical 3-picoline is best effected via the ethiodides which are prepared by heating III and Et_2O at 100 $^{\circ}$. The crude product gives yellow-brown crystals, m.p. 208 $^{\circ}$, which are decolorised when exposed to sunlight and converted into colourless compound of the same composition. 3-Picoline purified via the quaternary salt with 1 : 2 : 4- $\text{C}_6\text{H}_4\text{Cl}(\text{NO}_2)_2$ does not give a trace of condensation product and is regenerated almost quantitatively, whereas the yield of $\text{CH}_3\text{C}_6\text{H}_4\text{CO}_2\text{H}$ is increased considerably. Boiling a mixture of technical 3-picoline (PhCHO , Ac_2O , KOAc , and a trace of I for 40 hr. yields $\text{CH}_3\text{C}_6\text{H}_4\text{CHO}$ (28%), distyrylpyridine, and 4-styrylpyridine, m.p. 125 $^{\circ}$; the last named substance forms an ethiodide, $\text{C}_{16}\text{H}_{13}\text{NI}$, m.p. 183 $^{\circ}$, crystallising in various forms which are not mutually depressing, and a picrate, $\text{C}_{16}\text{H}_{13}\text{O}_7\text{N}_4$, m.p. 221 $^{\circ}$. A boiling mixture of 2-methylquinoline (0.1 mol.) (purified through the additive compound with ZnCl_2), PhCHO (0.13 mol.), Ac_2O (0.15 mol.), KOAc (0.1 mol.), and a little I gives after 40 hr. 2-styrylquinoline, $\text{C}_{16}\text{H}_{13}\text{N}$,

[m.p. 88 $^{\circ}$, in 70% yield]. Boiling oxindole with a similar mixture for 8 hr. affords an 81% yield of 3-benzylideneoxindole, m.p. 176 $^{\circ}$. Analogously, COPh₂ and PhCHO are condensed to chalcone (dibromide, m.p. 157.5 $^{\circ}$). A condensation product is not obtained from camphor, CH_3Ph , fluorene, acenaphthene, n- or $\mu\text{-NO}_2\text{C}_6\text{H}_4\text{OH}$, or 2 : 4 : 1-($\text{NO}_2\text{C}_6\text{H}_4\text{OH}$)₂.

BH HORAK, M.

KIT-6

6-Styryl-2-methylpyridine. *N. Horak and J. Stanek (C. R. Trans. Acad. Sci., 1880, 15, 1046-1049).* In addition to 2 : 6-distyrylpyridine, the condensation of 2 : 6-dimethylpyridine with PhCHO leads to 6-styryl-2-methylpyridine, m.p. 38°, which is converted by further condensation with PhCHO into 2 : 6-distyrylpyridine. The compound described by Schuster (*Ber.*, 1892, 25, 2306) as 6-styryl-2-methylpyridine is later regarded as 2-styryl-4-styrylpyridine.

A mixture of 2 : 6-dimethylpyridine (0.8 mol.), PhCHO (1.8 mol.), and Ac₂O (100 c.c.) is brought into reaction as described in the preceding abstract; excess of PhCHO is removed with steam and 2 : 6-distyrylpyridine (**I**) as the hydrochloride. The remainder when made alkaline with NH₃ gives a dark oil separated by distillation into an unidentified fraction (3.8%), b.p. 150-180°/4 mm., and 6-styryl-2-methylpyridine, C₁₄H₁₁N (**II**) (14.2% reckoned as **I**), m.p. 38°, b.p. 174°/4 mm. **II** furnishes a *fluoride*, C₁₄H₁₀F₃N, m.p. 21°, and a *dibromide*, C₁₄H₁₀NBr₂, m.p. 178°. Boiling **II** with PhCHO and Ac₂O in presence of a dehydrating agent yields **I**.

Title : On Terpenes. LXVII. Hydrogenation Products of Santonin and Alantolactone

Orig Pub : O terpenech. LXVII. Hydrogenacni produkty santoninu a alantolaktonu.
Chem listy, 1955, 49, No 12, 1856-1869 (Czech); Sb. chekhosl. khim.
rabit, 1956, 21, No 1, 225-239 (English)

Abstract : On hydrogenation of santonin (I) under different conditions, are formed three isomers of 3-ketosantonolide-5,12 (IIa, b and c), and on further hydrogenation there are obtained the corresponding 3-hydroxysantonolides-5,12 (IIIa, b, c). On reduction according to Clemensen, IIa and IIc give santonolide-5,12 (IVa), while IIb is converted to santonolide-5,12 *sic* (IVb). On interaction of IIa, b and c with ethylenedithiol (V) there are obtained ethylene thioketals, which on desulfurization with skeleton Ni form, respectively, IVa, b and c. IIc is readily isomerized to IIa. LiAlH₄ reduces IVa to santandiol-5,12 (VI), and alantanolide-5,12 (VII) to alantandiol-5,12 (VIII). Presented are the

infrared spectra of IVa, b and c, VII, IIIa, b and c, IIIc, VI, VIII,
5,12-oxidosantan (IX) and alanten- Δ (?) -ol-12 (X). On hydrogenation
of 0.1 mole I in 200 ml CH₃OH with Pd/BaCO₃, IIIa is obtained, yield
74%, MP 158°, [α]₁₈^D +30° ± 1° (c 5.0) (all [α]_D determined in chlo-
roform); mother liquors of IIa are evaporated, residue dissolved in a-
queous NaOH, after acidification ether is used to extract 3-keto-5-hy-
droxy-santanic acid (XI), yield 10.8%, MP 190-192° (from 50% CH₃OH),
[α]₂₀^D +20.7° ± 1° (c 7.45). Solution of 2 g XI and 0.5 g p-toluene
sulfonic acid (XII) in 50 ml CH₃COOH held for 5 hours, diluted with
water and extracted with ether to recover IIb, yield 89%, MP 103-105°
(from 70% CH₃OH), [α]₂₁^D +11.3° ± 1° (c 3.88). By hydrogenation of
IIb in glacial CH₃COOH with PtO₂ is obtained IIIb. MP 213-215° (from
CH₃OH), [α]₂₀^D -8.5° ± 1° (c 4). 4 g I are hydrogenated in CH₃OH with
PtO₂ (120 atm, 20°), to get IIIc, yield 44%, MP 135° (from 50% CH₃OH),
[α]₂₀^D +42.7° ± 1° (c 3.97). Mixture 0.66 mole CrO₃, 0.1 ml water,
1 mole IIIc and 6 ml CH₃COOH left standing 20 hours, diluted with water
(6 ml) and several drops alcohol, evaporated, and ether extraction

gives IIc, MP 145-146°, $[\alpha]_{D}^{20} + 77.5 \pm 2^{\circ}$ (c 5.12). 0.01 mole IIa reduced according to Clemenensen (8 g Zn; 21 ml HCl; 1:2, boiled 12 hours), ether extraction gives IVa, yield 93%, MP 154° (from 90% alcohol), $[\alpha]_{D}^{20} + 26.8 \pm 1^{\circ}$ (c 4.45). In the same manner from IIb is obtained IVb, yield 70%, MP 86-87° (from alcohol), $[\alpha]_{D}^{20} - 27.9 \pm 2^{\circ}$ (c 3.8). 100 mg IIc boiled 12 hours with 4 ml HCl (1:2), to get 65 mg IIa. Mixture of 0.01 mole IIa, 50 ml glacial CH₃COOH, 0.01 mole V and 0.96 g XII, held 3 hours at 200°, poured on ice, to get ethylene thioketal IIa, yield 99%, MP 195-196° (from ethyl acetate), $[\alpha]_{D}^{20} + 44.7 \pm 1^{\circ}$ (c 4.95), which (0.005 mole) on boiling for 8 hours in 120 ml dioxane with 15 ml skeleton N1 I gives IVa with yield 93%. Analogously from IIb is prepared ethylene thioketal, yield 81%, MP 122-123° (from CH₃OH), $[\alpha]_{D}^{20} - 11.08 \pm 1^{\circ}$ (c 6.32), and from it IVb, yield 95%. Under the same conditions IIc is converted over the ethylene thioketal (yield 95%, MP 166-167° (from ethyl acetate), $[\alpha]_{D}^{20} + 37.9 \pm 1^{\circ}$ (c 3.95)) into IVc, MP 137-139° (following crystallization from alcohol and di-iso-propyl ether, and sublimation (12 mm,

Card 3/5

and their synthetic analogs

E-3

Abs Jour : Referat Zhur - Khimiya, No 4, 1957, 11823

110°)), $[\alpha]^{20}_D + 92.2 \pm 2^\circ$ (c 3.73). Mixture of 0.1 mole LiAlH₄, 0.05 mole IVa and 600 ml ether is stirred 2 hours, decomposed with 6 ml water and 200 ml 25% H₂SO₄, and VI is extracted with ether, yield 98%, MP 154-155° (from benzene), $[\alpha]^{20}_D 25.3^\circ \pm 1^\circ$ (c 4.12 in chloroform-CH₃OH, 1:1). 2 mole VI dissolved at 0° in 5 ml SOCl₂, after 1.5 hour SOCl₂ driven off, following chromatography on Al₂O₃ (petroleum ether) there are obtained 180 mg cyclic sulfite of VI, MP 75-76° (from alcohol), $[\alpha]^{20}_D -253^\circ \pm 2^\circ$ (c 2.84), which is saponified in aqueous-alcoholic NaOH to get VI. Boiling for 30 minutes of 2.5 mmole VI with 0.1 g XII in 12 ml C₆H₆ gives IX, yield 84%, BP 132-133°/8 mm, n^{20}_D 1.4972, d_4^{20} 0.9788, $[\alpha]^{20}_D -39.54^\circ$. On steam distilling 3 kg of Inula Helenium roots, crystallizing the distillate from 70% alcohol and hydrogenating the product at 45° with PtO₂, in ethyl acetate, there are obtained 16.3 g of VII, MP 147-147.5° (from alcohol), $[\alpha]^{18}_D + 14.6 \pm 1^\circ$ (c 1.92). On reduction of VII with LiAlH₄ VIII is obtained, yield 93%, MP 111-112° (from benzene-petroleum ether, 1:3), $[\alpha]^{20}_D -6.2 \pm 1^\circ$ (c 4.55). VIII is converted to cyclic sulfite (like VI) yield 47%, MP

Abs Jour: Ref Zhur - Khimiya, No. 8, 1957, 26971.

after their saponification, 16-Benzolate of II (VI) and 16-benzoate of III (VII) were produced from II and III, these benzoates produced 16-benzoate of IV (VIII) and 16-benzoate of V (IX) correspondingly after partial saponification. By the oxidation of IX according to Oppenauer, benzoate of Δ^4 -androstene-16 β -one-3 (X) was obtained, which produced Δ^4 -androstene-16 β -one-3 (XI) after saponification. The configurations of the produced substances were established by the hydrogenation of IV to androstandiol-3 α ,16 α (XII) with its following benzoylation into the known dibenzoate XII (XIII) (see RZhKhim, 1956, 19357). 3 g of I are hydrogenated in CH_3OH on powdered

previously assumed, but that of the ketone (Ia).
The authors propose the name Germacrone for Ia.
The structure of Ia has been proved spectroscopically and by chemical reactions! The hydrogenation of I in glacial CH_3COOH over a Pt (from PtO_2) catalyst gives a liquid product (II) which on reduction with LiAlH_4 gives hexahydrogermacrol (III). The oxidation of II with CrO_3 in glacial CH_3COOH gives hexahydrogermacrone (IV). IV like Ia does not form a semicarbazone and 2,4-dinitrophenylhydrazone derivative. The reduction of I by aluminum isopropylate or by LiAlH_4 gives germacrol (V) which on dehydration yields a hydrocarbon (VI). The dehydrogenation of V

or of VI with S gives guiazulene (VII). The hydrogenation of VI in glacial CH_3COOH over Pt (from PtO_2) with 4 moles of H_2 gives elemane (VIII); the hydrogenation of V under the same conditions gives solimanane (IX). The hydrogenation of I over Pt (from PtO_2) in alcohol gives α, β -unsaturated tetrahydrogermacrone (X). The reduction of X by LiAlD₄ gives tetrahydrogermacrol (XI) which on hydrogenation in glacial CH_3COOH over Pt (from PtO_2) gives the saturated hydrocarbon germacrane (XII) and XIII. The IR spectrum of XII differs from the spectra of saturated sesquiterpenic hydrocarbons and resembles the spectra of humulane and farnesane (see KZhKhin, 1953, 8544). The dehydra-

Relation between infrared and ultraviolet absorption frequencies. O. Exner, M. Horak, and J. Pliva (Czechoslovak Acad. Sci., Prague). *Chem. & Ind. (London)* 1958, 1174-5.
Infrared CO stretching frequencies ν_{CO} (measured in dioxane) can be related to the ultraviolet K-band frequencies ν_K (measured in EtOH) approx. by $\nu_K = A + B\nu_{CO}$ ($A = 63.54 \times 10^3 \text{ cm}^{-1}$ and $B = -23.08$) for the series BzR where R = NMe, NHIOH, NHNH₂, NH₂, OH, OMe, OEt, OPh, ON(CMe₂)₂, ONCOPh, and for Bz₂O. By using Taft's values (cf. C.A. 51, 9073) for the inductive and mesomeric contributions σ_I and σ_M , and substitution in his equations, $\nu = r^2(1 + \sigma_{IK} + \sigma_{MK})$ separately for ν_{CO} and for ν_K gives $\sigma_{IK} = 0.1063$, $\sigma_{MK} = 0.0284$, $\nu_{CO} = 1705.3 \text{ cm}^{-1}$, and $b(\nu_K) = 0.0158$, $a(\nu_K) = -0.1170$, and $r^2 = 40.74 \times 10^{-4} \text{ cm}^{-1}$, so that $\nu_K = 0.670 + 0.603 \nu_{CO}$, which holds for R = OX and NXY but not for R = H or Me, i.e., only for these carboxylic acid derivs. W. B. WILSON

HORAK, M.

Matra 153d 7
Infrared spectroscopy of carboxylic acid derivatives.
Milan Horák and Otto Exner (Ceskoslov. akad. věd.
Prague). Česk. Kém. listy 52, 1451-9 (1958). Valence vibrations
of the CO bond were measured in 80 derivs. under
standard conditions in dioxane. The frequency values in the
individual compds. change regularly and stoichiometrically in de-
pendence on the function group and can be thus expressed by
an equation by means of experimentally detd. constns.: The
position of the CO max. is given by a straight line equation
 $\nu_{CO} = \nu_0 + \alpha x$, where ν_0 is the const. for a certain acid, x is the
const. for a certain deriv., and α is the const. mutual to all
measured compds. Where $\nu_0 = 1813.9 \text{ cm}^{-1}$, α for the fol-
lowing acids is given: $\text{CCl}_3\text{CO}_2\text{H}$ 1.212, $\text{NCCl}_3\text{CO}_2\text{H}$ 1.140,
 AcOH 1.118, $\text{H}_2\text{NCO}_2\text{H}$ 1.078, $\rho\text{-O-NC}_2\text{H}_4\text{CO}_2\text{H}$ 1.020, $\text{Be-}\text{DH}$ 1.000, $\sigma\text{-H}_2\text{NC}_2\text{H}_4\text{CO}_2\text{H}$ 0.876, $\sigma\text{-HOCH}_2\text{CO}_2\text{H}$ 0.797.
Also, α for various acid derivs. is as follows: bromide 270.8,
chloride 264.1, anhydride 251.5, Ph ester 228.1, Me ester
212.4, acid 203.9, Et ester 208.8, amide 178.3, anilide 164.8,
hydr azide 159.5, hydroxamic acid 148.7. This relation-
ship can be used to predict the frequencies of further compds.
of a given type. Various factors influencing the CO fre-
quency are discussed. The polar effect of a directly bound
atom is the most important and thus enables to differentiate
compds. having a N- or O-bound acyl in comparison with
simple derivs. L.J. Váňa

ABSTRACT: Study of the vibration spectra of methyphenyl siloxanes enabled determining the analytical frequency of individual mono-function and di-function siloxane units in the molecule. By means of these frequencies it is possible to make a qualitative analysis of the individual substances and of mixtures by means of their infra-red and Raman spectra. In this paper the authors used the compounds prepared synthetically (linear, symmetrical, methylphenyl-trisiloxane and butoxy siloxane) by means of a method described by Balanc and Simes (Ber 12). This enabled obtaining extensive experimental information on substances of a guaranteed constitution for which it was possible to verify the individual analytical frequencies in a sufficiently large number of cases.

Since the authors anticipated additive properties in individual infrared absorption bands, they measured the apparent extinction coefficients for all frequencies between 1,250 and 697 cm⁻¹. The carried out quantitative analysis is of importance in studying the progress of reactions of methyphenyl siloxanes (See 13,14). The authors verified the additive properties in most of the characteristic bands and established the quantitative analytical bands for the methyl group and the phenyl group in the molecule. In the analysis of ultra-violet spectra the authors found the existence of good additive properties in the band around 265 m μ . In addition to general determination of the number of methyl groups in the molecule, the used method also enabled determining the number of individual siloxane units in the molecule. For instance, of methyl siloxane by determining the apparent extinction coefficient for the band at 640 and 750 cm⁻¹; similar additive relations also apply for most of the phenyl frequencies (particularly for the bands 995 - 697 cm⁻¹) and for certain phenylised units, for instance, trimethyl siloxane. However, however, determination of the real number of phenyl groups in the molecule can be carried out more conveniently by quantitative analysis of the ultraviolet spectra, the accuracy of which is very high (see Table 6); since the different types of all the methylphenyl siloxanes measured by the authors have the same appearance and they differ only in intensity.

TITLE: On Terpenes (C Terpenes) I. LIV. Structure of Lactucine
(ICIV. Strukturna laktutina)
PERIODICAL: České Akademie věd, Matematický ústav, Vol. 52, Nr 11, pp 2094 - 2099
(Czechoslovakia), Chemický Listy, 1958, Vol. 52, Nr 11, pp 2094 - 2099
ABSTRACT: Lactucine C₁₅H₂₀ and its p-hydroxyphenylacetate lactucopacrin C₂₀H₂₂O₇ have long been known to be the bitter principles of certain members of the Composite (e.g. Lactuca virosa, Cichorium intybus). The structure of lactucine was previously examined in detail by Späth and by Wessely in the early 1950's. According to these authors it is a sesquiterpene lactone which yields on saponification dicypropanone, uncharacterized acids, etc. The authors state that present papers state they are able to show that lactucine has a trisubstituted cyclohexene with an unsaturated lactone ring closed at position 6. On the basis of U. S. Pat. No. 2,914,416, a spectra they formulate a diene system for lactucine situated in the phthalanidine skeleton. One of the hydroxyls of lactucine is a substituent. Card 1/2

Secondary one on C(8) is the second is a primary one most likely situated on C(14). The partitions give further evidence for structure I for lactucine in addition to that given previously (Ref. 5) and which appeared simultaneously with that of Barton and Maruyama (Ref. 6). The authors also propose the absolute configurations of certain asymmetric centers. There are 17 references, 5 of which are Czech, 4 German, 1 Argentine and 7 English.

ABSTRACT: Kiryllov (Bar 2) proposed I for ledol ($C_15H_{26}O$) a sesquiterpene isolated from Ledum palustre and certain other plants. This structure has been criticised by de Mayo and by Lahay and Lambertson (Ref 4). The latter showed the absence of an absorption band in the region 3024 - 2958 cm^{-1} in the infra-red spectra of ledol, which is characteristic for cyclopropane rings with unsubstituted methyl groups. On the basis of this observation and certain further results, which the authors now report in more detail, two alternative structures of ledol are proposed, analogous to the structures of globol and aristolacten. In the infra-red spectra of ledol the authors failed to obtain an absorption corresponding to an 180- cm^{-1} band of about 1175 cm^{-1} , which corresponds to an 180- cm^{-1} band of about 1175 cm^{-1} . Both Korppele (Ref 5) and (Decorty)ledol is produced.

Card 1/8

propyl group. (See alcohol group.)
 By hydrogenation of the alcohol group (Ref 10) call it dihydro and
 (Ref 9) and Kir'yakov (Ref 10) call it dehydro. The infrared spectrum
 fail to differentiate it from the dehydro product of leadol. The required frequency
 hydrogenation products of leadol and differs fundamentally
 is similar to arandominane and is similar to kadinane.¹ The required frequency
 from the spectrum of kadinane "cyclic hydrododecene".
 occurs only in the spectrum of "cyclic hydrododecene" which
 occurs only in the spectrum of two double bonds obtained
 unsaturated hydrocarbons with two double bonds obtained
 from leadol by the action of alcholic H₂O₂. The
 reaction leads to the dehydration and degradation of the
 cyclopropane ring. Chemical evidence also exists which
 supports III. With the opening of the cyclopropane
 ring with HBr and the dehydrohalogenation of broso-
 derivative produced with collidine, an unsaturated hydro-
 carbon was obtained, the combination of which yielded
 acetone, formaldehyde and a mixture of higher ketones.
 An absorption band at 1103 cm⁻¹ was discovered in the
 infrared spectra of the higher ketone mixture, which is
 characteristic for carbonyl groups in seven or higher-
 membered rings. Similar results were also obtained by the isomerization
 of dehydroleadol on silica columns. No direct evidence has
 been given for the position of the tertial hydroxyl group.¹ Kir'yakov
 proposed that the hydroxyl is on a carbon which is a carbon of ledone (II).

The usual procedure. Evacuated and
heated to 152° Br. or evaporation.

HORÁK, M.

Nature of the solvent effect in the infrared spectra of carbonyl compounds. M. Horák, J. Jonáš, and J. Plíšek (Czechoslovak Acad. Sci., Prague). *Tetrahedron Letters*: 1959, No. 3, 19-23.—The infrared frequencies of the CO stretching vibration of various carboxylic acids, ketones, and aldehydes were measured in a variety of solvents and a linear relationship established between the frequency shifts $\Delta\nu_{CO}$ and the CO stretching frequencies ν_{CO} (C_6H_6) for carboxylic acid derivs., $RCOX$ ($X =$ halogen, OR' , $NR'R''$). The linear relation $\Delta\nu_{CO} = A(1 - \alpha\nu_{CO})$ was valid within $\pm 2\text{ cm.}^{-1}$ for $BzOH$ derivs. (A 283.4 cm.^{-1} , α $0.5423 \times 10^{-3}\text{ cm.}$) and $AcOH$ derivs. (A 380.4 cm.^{-1} , α $0.5394 \times 10^{-3}\text{ cm.}$) but not valid for ketones and aldehydes. Previously (cf. Exner et al.; *C.A.* 53, 8803f) an analogous behavior of $RCOX$ derivs. was observed in correlations between the infrared CO stretching frequencies and the ultraviolet K-band absorption frequencies. The linear relation between the infrared and ultraviolet frequencies was shown to be related to a relationship between Taft's parameters σ_I and σ_a (inductive and mesomeric effects of the substituents X) (*C.A.* 51, 9307b). A linear relation $\Delta\nu_{CO} = \Delta_b(1 + a\sigma_I + a\sigma_a)$ was found to be valid for aldehydes and ketones as well as $RCOX$ compds. For both $BzOH$ and $AcOH$ derivs. the relation is valid with $a_I = 2.1$, $a_a = 2.9$, and the values of the parameters Δ_b 8 cm.^{-1} for $R = Ph$ and Δ_b 11.5 cm.^{-1} for $R = Me$ correspond to the frequency shifts observed for the corresponding aldehydes. The effect of solvents on bond frequencies is dependent on the properties of the solvent and the solute and on their specific interactions. The differences in frequencies found above in nonpolar and polar solvents were related to the polar properties of the substituents directly attached to the bond under observation.

✓ Spectroscopic properties of the gem-dimethyl group on cyclopropane and of the isopropylidene group. M. Horák and J. Pliva (Chemický Ústav ČSAV, Prague). Callahan 1-BW (RW) D-JAT (RE) (MAY)

Czechoslov. Chem. Commun., 25, 1670-82(1990).—The infrared spectra of compds. with the gem-dimethyl group on the 3-member ring or with the isopropylidene group exhibit only a single band in the symmetrical $\delta(\text{CH}_2)$ bending region, in contradiction to the compds. contg. the isopropyl group or the normal gem-dimethyl group. This anomaly is explained from the viewpoint of geometry of both groups.

✓ Organosilicon compounds. IX. Determination of the basicity of the silicon-bound oxygen by infrared spectroscopy. M. Horák, V. Balint, and V. Chvalovský (Ústav org. chemie a biochemie ČSAV, Prague). Czechoslov. Chem. Commun. 25, 2822-30 (1960) [in German]. cf. CA 54, 24478a.—The formation of the H-bond between various proton donors and isostuctural alkyl ethers, alkoxysilanes, and siloxanes was studied. The basicity of the O atoms decreases in the series of groups: COC, COSi, and SIOSi; this effect is attributed to the partial formation of the multiple bond in the SiO group. The induction and steric effects of alkyl groups on H-bond formation were studied. E. Haderer

TITLE: Production of phosgene from carbon tetrachloride. CZ Pat. No. PV 6709-62, Class 42

SOURCE: Vynalezy, no. 11, 1965, 21

TOPIC TAGS: phosgene, carbon compound, vaporization

ABSTRACT: An Author Certificate has been issued for a low-concentration phosgene-producing unit. It includes a drying tower with a two-branch outlet pipe. One branch is connected, via a flowmeter, to a vaporizer containing carbon tetrachloride; the vaporizer, in turn, is connected to an electrically heated retort where the phosgene is produced from the vapors of carbon tetrachloride and air oxygen. The other branch is connected, via another flowmeter, to a mixer, which in turn, is connected to the phosgene producing retort. [KP]

TITLE: Conference on some problems of macromolecular chemistry

PERIODICAL: Chemický průmysl, no.1, 1963, 53-54

TEXT: The conference, organised by the Ústav makromolekulární chemie ČSAV (Institute of Macromolecular Chemistry, CSAV) was held in Prague in September 1962. There were three independent sections. In Section I, relating to macromolecular structures and mechanical properties, the following subjects were reported on: V. Svoboda and O. Karásek (VÚSK, Gottwaldov): effects of "spherical" purity of polydienes on their physical properties; K. Dušek (VÚSPL, Pardubice): elastic properties of styrene and divinylbenzene copolymers; J. Majer and Stejny (VÚMCH, Brno): thermal history of paraformaldehyde and the effect on its properties; J. Hugo and M. Jirouš (SVÚMT, Prague): rheological studies for determining the mechanical properties of polyvinylchloride; M. Možíšek (VUGPT, Gottwaldov): determining the dispersion of elastomers by tracer elements; L. A. Igonin (NIIPM, Moscow): effects of macromolecular

structures on the mechanical properties of crystalline polymers;
V. Zilvar, J. Boukal and J. Hell (SVÚNT, Prague): structure and
properties of alkaline polyamides compared to hydrolytic polyamide;
N. F. Bakeyev (Leningrad): structural peculiarities of various
macromolecular spherulites, e.g. poly-ethylenesabacate;
Z. Pelzbauer (ÚMCH ČSAV, Prague): study of the macromolecular
structure of caprolactam by electron microscopy and electron
diffraction.

In Section II, relating to the study of polymers by physical and
physico-chemical methods, the following subjects were reported on:
M. Bohdanecký (ÚMCH ČSAV, Prague): possibility of indirect
determination of constant K in Mark-Kuhns' equation; P. Munk and
P. Lesse (ÚMCH ČSAV, Prague): new methods for the determination of
diffraction during flow; J. Moravec (VUGPT, Gottwaldov): study of
various viscometers; M. Bohdanecký, P. Kratochvil, P. Munk,
O. Quadrat (ÚMCH ČSAV): aggregation of molecules, determined by
viscosity, light-scattering and diffraction methods during melt-
flow; M. Hloušek (VÚMCH, Brno): determination of polydispersion of
latex particles by means of scattering of transmitted light;
M. Kubín and E. Prokopová (ÚMCH ČSAV, Prague): synthetic gels for

the separation of high- and low-molecular weight substances; J. Poláček (ÚFCH ČSAV, Prague): modification of the Baker-Williams fractionation column; J. Biroš and J. Pouchlý (ÚMCH ČSAV, Prague): new microcalorimeter and ebulliometer with thermistor recording; J. Jokl (ÚMCH ČSAV, Prague): infrared studies of the structure of polycaprolactam; D. Doskočilová (ÚMCH ČSAV, Prague): newer determination of the structure of poly- γ -methyl- ϵ -caprolactam by infrared spectrography; J. Jakeš (ÚMCH ČSAV): effects of non-homogeneity of solid polymer dispersions on absorption spectra; F. Rybníkář (VÚGPT, Gottwaldov): secondary crystallisations in samples of polypropylene and polyamides; Z. Menčík (VÚMCH, Brno): crystalline structure of polyethylene-2,6-dinaphthionate; H. Prokopová and Z. Pelzbauer (ÚMCH ČSAV, Prague): microscopic studies of polyvinyl particles.

In Section III, relating to accelerated polymerisation of caprolactam, the following subjects were reported on:

J. Stehlíček (ÚMCH ČSAV, Prague): catalysts for the alkaline polymerisation of caprolactam; A. P. Grekov (USSR): accelerated polymerisation of caprolactam in solvents; P. Čefelín (ÚMCH ČSAV): polymerisation of pure γ -methyl-6- caprolactam, using tetraacetyl-

Zapotockeho)TITLE: Apparatus for continuous preparation of low phosgene⁶ concentrations in air

SOURCE: Chemicke listy, no. 9, 1965, 1070-1073

TOPIC TAGS: phosgene, safety engineering

ABSTRACT: The authors designed an apparatus for testing analytical devices that are used for industrial safety applications. It can be also used for biological experimentation. Carbon tetrachloride is oxidized in an electrically heated platinum probe by a stream of air. The concentration of phosgene in the stream of air is regulated by the temperature of the probe, while the amount of air remains constant. The concentration of phosgene can be regulated between 0.1 and 10 micrograms per liter of air. Orig. art. has: 2 figures. [JPRS]

TITLE: Apparatus for continuous preparation of low concentrations of hydrogen cyanide and cyanogen chloride in air

SOURCE: Chemicke listy, no. 3, 1966, 347-349

TOPIC TAGS: cyanide, cyanogen compound, chemical laboratory apparatus

ABSTRACT: The apparatus can be adjusted to produce desired concentrations of the substances in air. Hydrocyanic acid and cyanogen chloride are supplied from the decomposition of formamide vapors in a special electrically heated cell containing aluminum oxide. The concentrations can be adjusted within the limits of $1 \cdot 10^{-3}$ and $5 \cdot 10^{-2}$ mg of hydrocyanic acid or cyanogen tetrachloride in a liter of air. Cyanogen chloride is produced by hydrocyanic acid in a special chlorinating tube. Orig. art. has: 2 figures. [Based on authors' Eng. abst.] [JPRS: 36,002]

TITLE: Lubricating oils from hydrogenated fraction of Mukhanovo and Romashkino petroleum mixture

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 1, 1962, 446, abstract
1M160 (Ropa a uhlie, v. 3, no. 5, 1961, 138)

TEXT: A hydrogenated fraction (d_4^{20} 0.865, viscosity 20.7 centistokes/ 50°C) of a mixture of Mukhanovo and Romashkino petroleums is deparaffinized in a solution of dichloroethane mixed with benzine; 81% of deparaffinized fraction is obtained which, after refining with 1.1% bleaching clay at $200-210^{\circ}\text{C}$, had d_4^{20} 0.877, viscosity 26.7, viscosity index 91, flash point 198°C , solidification point -6°C , acid number 0, cokability 0.14. Mixing 67% of the refined hydrogenated fraction with 33% heavy selectively refined oil from Saratov petroleum gave a motor fuel. A turbine oil

(d_4^{20} 0.872, viscosity 25.1 centistokes, viscosity index 95, solidification point -8°C, cokability 0.046%) was obtained from another deparaffinated sample of the hydrogenated fraction refined with 15% conc. H_2SO_4 , 4% NaOH in water and 1.5% bleaching clay. This turbine oil meets the requirements of the OT-T3 (OT-T3) standards. [Abstracter's note: Complete translation.]

Variation of alkaloid content in Ergot sclerotium during 24 hours.
Cesk. farm. 2 no.7-8:231-233 Aug 1953. (CIML 25:4)

1. Of the Research Institute of Medicinal Plants, Prague.

The amount and distribution of alkaloids in the sclerotization of *Claviceps purpurea*. Z. Balick, J. Bošáček, P. Horák, and J. Kybal (Inst. Med. Plant Invest., Prague); *Příroda* 8, 592-6 (1963). Larger (heavier) sclerotia have higher alkaloid content than smaller; this is explained as resulting from the different nutrition both qualitatively and quantitatively of the host plant. The external dark pigmented layers of the sclerotia are richer in alkaloids than the internal white layers of plectenchyma. There is apparently also a higher content of alkaloids in the basal part of the sclerotia than in the apical. The small apical caps (remains of sporocolla stage), sometimes present, contain practically no alkaloid. The leucosclerotia (whitish sclerotia) have a lower alkaloid content than the normal dark colored.
